## PROCEDURE AND SCORING

### EXERCISE:

1. Participant stands flat-footed with their legs shoulder-width apart.
2. Participant raises their arms laterally to a 90-degree angle (shoulder height) and holds that position. Their body should form a T-position.
3. Participant holds their arms at 90 degrees for as long as possible without dropping them below shoulder height.

### NOTES:

1. Participant will receive one warning if they bring their arms above or below 90 degrees. If a participant is warned for a second time, the time will be stopped, and the score will be recorded.
2. Participant should not walk or move around when completing this exercise.
3. Focus on keeping participant's neck long and natural. Elevating the shoulders can cause neck tension if done improperly.
4. Dumbbells can be used to increase the difficulty of the exercise, but the test is designed to complete on body weight alone.

**SCORING:** The total amount of time to failure is counted as the final score. If the participant holds the exercise for more than 55 seconds, they have achieved the maximum score.
